

Some revision questions for COMP131 written exam 1

Note: these revision questions cover *only* hypothesis testing and Boolean expressions. The exam covers everything up to and including topic 16.

1. After driving from Carlisle to Harrisburg many times, I determine that the freeway route averages 35 minutes with a standard deviation of 10 minutes, whereas the route on surface streets averages 43 minutes with a standard deviation of 5 minutes. Is the hypothesis that the freeway is faster supported strongly, weakly, or not at all according to the criterion taught in this course? Explain your answer.

For the remaining questions, assume the following local variable declarations:

```
int x = 7;
int y = -3;
boolean a = true;
boolean b = false;
```

2. What is the value of each of the following Boolean expressions?

```
i.   (x <= 0) && (y > 0);
ii.  (x == 9) && (y > 2);
iii. !((x > 0) && !(y < 0));
iv.  a;
v.   a || b;
vi.  a && !b;
vii. !(a && x < 10 && y > 0);
```

3. What is the output of each of the following fragments of code?

```
(i)      if (b) {
          System.out.println("apple");
        } else {
          System.out.println("banana");
        }

(ii)     if (a && !b) {
          System.out.println("apple");
        } else {
          System.out.println("banana");
        }

(iii)    if (a == true) {
          System.out.println("apple");
        } else {
          System.out.println("banana");
        }
```

```
(iv)      if (a) {  
           System.out.println("apple");  
        } else {  
           System.out.println("banana");  
        }  
  
(v)       if (b == false) {  
           System.out.println("apple");  
        } else {  
           System.out.println("banana");  
        }  
  
(vi)      if (!b) {  
           System.out.println("apple");  
        } else {  
           System.out.println("banana");  
        }
```
