## COMP 131 Practise Final Exam (200 points total)

name:	Solutions

Question 1. (10 points) What was the significance of the development of the stored program architecture, in which both programs and data are stored in memory?

Many possible answers are acceptable. Mention simplicity,
flexibility and efficiency of the stored program architecture,
and the fact that it is the dominant computing would
today, and paved the way for drawatic improvements in
technology.

Question 2. (10 points) Briefly explain three of the following four "big ideas" of software engineering: re-use, divide-and-conquer, abstraction, and modularity.

All for siles are applications of composition.

. Re-use: using existing and in another context saver effort.

· Divide - and - wroper: split a complex problem . Into simple sub problems.

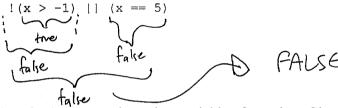

Asstraction: Use the interface of some code without knowing its implementation details.

Modularity: evene that complex problems are subdivided into smaller problems where solutions are independent and interact in well-defined ways.

## Question 3. (8 points) Fill in the body of the following method:

/\*\* A very unforgiving method to evaluate students' answers \* @return true if studentAnswer is the same as \* correctAnswer (with no difference in wording, \* capitalization, spacing, etc.) public boolean isCorrect(String studentAnswer, String correctAnswer) { if (student Answer equals (wirelet Answer)) } retur tre;
} else {
retur false;

Question 4. (5 points) Assume that x is a variable of type int whose current value is 3. What is the value of the following expression?

Question 5. (8 points) Assume that x is a variable of type int. Give a Boolean expression that will evaluation to true if x is any negative number besides -8.

Various GNSVes are possible, e.g. 
$$(\chi < 0) \&\& (\chi! = -8)$$

$$\cdot !(\chi > = 0) || (\chi = -8)$$
Question 6. 
$$(\chi < 0) \&\& (\chi < -8) || (\chi > -8)$$

$$\frac{1684211}{100001} \rightarrow 16+1 = 17.$$

(b) (5 points) Give the binary representation for the following base 10 number: 30

(a) (5 points) Give the base 10 value of the following binary number: 10001

$$\frac{16 \mid 8 \mid 4 \mid 2 \mid 1}{1 \mid 1 \mid 1 \mid 1 \mid 0} \longrightarrow || 1 || 0$$

$$\frac{1}{14 \mid \text{left}} = \frac{1}{6 \mid \text{left}} = \frac{1}{2 \mid \text{left}}$$

## Question 7. Consider the following method definition:

(a) (5 points) What output would be produced by the following method call:

(b) (10 points) Give a sequence of method calls that would produce statement coverage for this method.

many answer are possible e.g.

Mystery 
$$(1, 3, 2)$$
;  $\leftarrow$  tests  $(A)$ 

mystery  $(1, 2, 3)$ ;  $\leftarrow$  tests  $(A)$ 

mystery  $(A, 2, 3)$ ;  $\leftarrow$  tests  $(A, 2, 1)$ ;  $\leftarrow$  test

Question 8. (4 points) Give the output produced by the following code snippet.

int 
$$a = 6$$
;  
int  $b = 20$ ;  
int  $x = b / a$ ;  
int  $y = b % a$ ;  
System.out.println(x);  
System.out.println(y);  

$$\frac{3}{2} \left( + \text{ lateger arithretic} \right) \frac{20}{6} = \frac{3}{3} \text{ with } 2 \text{ remailer}$$

Question 9. (10 points) There is a rumor among the students at a certain college that Astronomy labs require less work than Chemistry labs. The student Senate conducts a survey of 100 students who have done each lab, collecting the total amount of hours spent throughout the semester on each lab by each student. The results can be summarized using means and standard deviations as follows:

meanstandard deviationAstronomy students15045Chemistry students19030

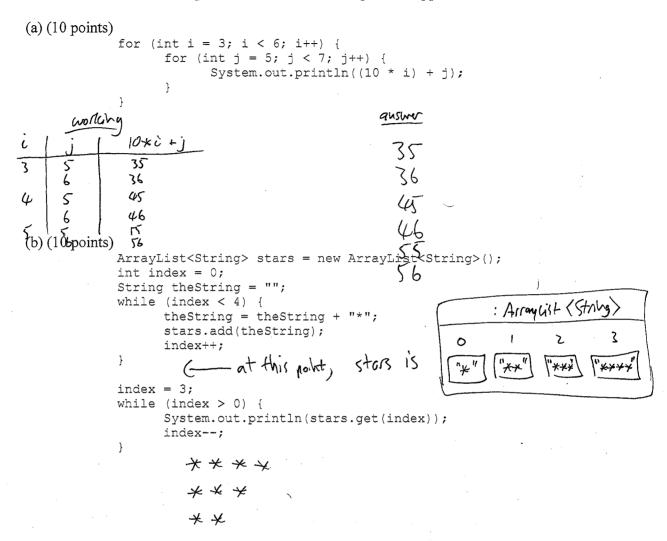

Do the results of the survey support the hypothesis that Astronomy labs require less work than Chemistry labs, according to the criterion taught in this course? If so, how strong is this support? Justify your answer with a clear explanation and/or a diagram.

The hypothesis is not supported by the data. A one-standard-deviation lateral about the Astronomy mean is given by 150 ± 45, or (105, 195). The mean for Chemistry, 190, lies inside this interval. Therefore, it is plansible that the true Astronomy mean is no larger than the true Chemistry mean, and the hypothesis is not supported.

Question 10. (15 points) Explain (i) the meaning of the Java keywords public and private; (ii) how they are used to achieve information hiding; and (iii) why information hiding is desirable in software development.

- (i) pullic code outside the current class can use of fields & methods
  private only acce inside the current class can use private fields & methods
- (ii) All fields are declared private; methods useful to other classes are declared public; nethods useful only to their own class are declared private. This hides fields and nethods from code that doesn't need them.
- (III) Into history is desirable because (a) it is less confishing to programmers if they can see only methods that might be useful, o (b) programmers commot very on implementation details that are hidden, so these electrists can be changed inthont breaking their code.

Question 11. Give the output of each of the following code snippets.

Question 12. (10 points) Rewrite the following snippet using a while loop.

Question 13. (40 points) Fill in all the fields, constructors, and methods of the following class. Hint: only one field is required.

```
/**
* A DailyTemperatures object stores a fixed length array of
 * temperatures, representing the daily temperature of some
 * number of consecutive days. Each day is identified with
 * an index; the earliest day has index 0, the second day
 * has index 1, and so on. All temperatures are represented
 * as integers, and are measured in degrees Fahrenheit. Note
 * that the freezing level in Fahrenheit is 32 degrees.
 * /
public class DailyTemperatures {
      public static final int FREEZING = 32;
      // insert your field here
     private int [] temperatures;
      * Construct a new object that will store the daily
       * temperatures of a fixed number of days, given by the
       * parameter numDays.
       * @param numDays the number of days whose temperatures will
                       be stored
      public DailyTemperatures(int numDays) {
          temperatures = new int (num Days);
      }
       * Set the value stored for the desired day to the
       * desired temperature. If the day is not valid, an
       * error message is printed.
       * @param day the index of the day whose temperature
                    will be set
       * @param temperature the new temperature value
      public void setTemperature(int day, int temperature) {
         if (day >=0 && day < temperatures. length) {
               temperatures (doy) = temperature;
          System.out. pnloth ("ihralid day");
         3 else 5
```

```
^{\star} Return the temperature value stored for a given day.
 * If the day is not valid, an error message is printed
 * and the value 0 is returned.
  Oparam day the index of the day whose temperature
   @return the temperature stored at the index given by
          the parameter day
public int getTemperature(int day) {
    if (day A)=0 all day < temperatures. length) {
         retain temperatures [day];
    3 else {
         return Os System. ont. palatin ("hvalid day");
        return O;
  Return the index of the first day whose temperature
 * is at or below freezing. If there are no days at or
  below freezing, this method returns -1.
  Greturn index of the first freezing day
public int firstFreezingDay() {
   for (it i=0; ic temperatures.length; i++) {
         if (temperature [i] <= FREEZING) {
                return i;
         return -1;
```

```
* Return the number of days whose temperature is at or
 * below freezing.
 * @return the number of freezing days
public int numFreezingDays() {
     ilt nun freezily = 0;
     for (lut 120; is temperatures, length; i++) {
            if (temperatures[i] <= FREGZING) {
                 numfreezhy ++;
     return numbreezing;
 * A particular type of basil plant dies if it
 * encounters two consecutive days that are at or below
 * freezing. This method returns true if the
 * temperatures stored in this object would cause such a
 * basil plant to die, and false otherwise. For example,
 * the method would return true if the sequence of
 * temperatures were 45, 35, 21, 30, 42 (because the
 * third and fourth days are at or below freezing), and
 * would return false if the sequence of temperatures
 * were 45, 21, 35, 30, 42 (because no two freezing days
 * occur consecutively).
 * @return true if the temperatures would kill a basil
          plant and false otherwise
public boolean basilPlantDies() {
     for (but i=0; ic temperatures. length -1; i++) {
           if (temperatures [i] <= FREEZING && temperatures [iti] <= FREEZING) }
                  return tre;
 3 expers
3 xeturn false;
return false;
```

Question 14. (10 points) Explain why the use of the class constant FREEZING in the code from the previous question constitutes good software design, when compared with a design that does not use any class constants. For full credit, give at least two separate reasons with accompanying explanations. Hint: imagine the code from the previous question is being revised for use in a European country where temperature is measured in Celsius, which has a different freezing level.

- (i) It is easier for a human to read and undestand the constant "FREEZING" rother than the literal value 32.
- (ii) If the code must be revised for a different freezing lavel, only one line needs to be changed (the value of the constant). This is less have and less error-prone.

Question 15. (15 points) The constructor and methods of the CelebrityAges class below each contain one error. Identify these 3 errors, and explain how to correct each one. (Note that the BirthYear class does not contain errors. Also, some JavaDoc comments were omitted to save space; this doesn't count as an error.)

```
/**
  * Class for storing the year in which a celebrity was born
  */
public class BirthYear {
        private int born; // year in which celebrity was born
        public BirthYear(int initBorn) {
            born = initBorn;
        }
        public int getBorn() {
            return born;
        }
}
```

```
import java.util.HashMap;
 * A CelebrityAges object stores a collection of
 * celebrities' names and the years in which they were born,
 * and uses these to calculate the celebrities' ages in a
 * given year
*/
public class CelebrityAges {
      // the type of celebrity whose ages will be calculated,
      // e.g. "pop stars" or "US presidents"
      private String celebrityType;
      // A HashMap storing the names of celebrities and the
      // years in which they were born. Specifically, in each
      // key-value pair, the key is the name of a celebrity
      // (e.g. "Bill Clinton") and the value is a BirthYear
      // object which stores the year in which that celebrity
      // was born (e.g. 1946).
      private HashMap<String, BirthYear> birthYears;
      public CelebrityAges(String celebrityType) {
            this.celebrityType = celebrityType;
            birthYears = nul;
                          > new HashMap < String, BiAt Year > ();
      }
      public void addCelebrity(String celebrity, BirthYear birthYear) {
            birthYears.put (birthYear);
                           celebrity 5
       * Return the age of the given celebrity in the year
       * currentYear, or -1 if the celebrity's birth year is
       * unknown.
       */
      public int getAge(String celebrity, int currentYear) {
            BirthYear birth = birthYears.get(celebrity);
if (birth null) {
                  int born = birth.getBorn();
                  return currentYear - born;
            } else {
                  return -1;
            }
      }
```

Question 16. (10 points) The BankAccount class below is a highly simplified implementation of a bank account in which the customer's balance is stored as a whole number of dollars. Note that constructors, accessors, and JavaDoc comments have been omitted to save space. Refactor the class by factoring out the repeated code into a new method and making any necessary changes to the existing code (cross out any code you want to change and write the new code next to it.)

```
public class BankAccount {
     private int balance;
      // constructor and accessor omitted to save space
     public void printBalance()
                                compute Dolla Word ();
            String dollarWord
            System.out.println("Balance is " + balance + " "
                        + dollarWord);
      public void withdraw(int withdrawalAmount)
            if (balance - withdrawalAmount >= 0) {
                 balance = balance - withdrawalAmount;
                                   = consiste Dollar Word ();
                  System.out.println("Error: can't withdraw, " +
                       because your balance is only " +
                        balance + " " + dollarWord);
      // insert new method here
     private String compute Dollar Word () {
           if ( Salance == 1) {
              return "dollar";
           3 else {
             return "dollars";
```
